

- Formulation for Brinkman flow with porosity and permeability $\underline{k(x)}$

Brinkman

$$\left\{ \begin{array}{l} \partial_t u + \underline{K}^{-1} u + \nabla \text{curl } w + \nabla p = f(c) \\ \text{div } u = 0 \\ w = \nabla \text{curl } u \end{array} \right.$$

weak coupling
↓

$$\left\{ \begin{array}{l} \partial_t c + \underline{u} \cdot \nabla c - \text{div} (D \nabla c) = g(c) \end{array} \right.$$

$\underline{K}(c, x)$

- blobs with low permeability.
(code + mpmc)

RandomCircle (center, radius, density)

lagrangian particles (V_u) → FE space for velocity!!

Brinkman-transport does not depend on Δp

lp. step (velocity, time step)

x_i

$$\dot{x} = u$$

$$\frac{x^{n+1} - x^n}{\Delta t}$$

$$x_i^{n+1} = \Delta t u + x_i^n$$

position

FE function

- Open xdmf file (with u, p, \dots)
- Open all particle files with the Treader
- Select Point Gaussian representation.
